

How can fMRI inform the structure of the mind?

Russell Poldrack

Department of Psychology
Stanford University

of PubMed abstracts mentioning fMRI

Do we really know an order of magnitude more now than we did in 2002?

Do we really know an order of magnitude more now than we did in 2002?

Will 45,000 more of the same kind of fMRI papers give us twice the understanding we have now?

Questions we would hope we could answer

- What does <insert brain area or system> do?
- How is <insert psychological process> implemented in the brain?

What does the anterior cingulate cortex do?

- “anterior cingulate” and fMRI
 - 3683 abstracts in PubMed
 - under conservative assumptions, ~\$22M USD

What does the ACC do?

maintenance

pain

phonology

interference

difficulty

conflict

errors

attention

playing 20 questions with nature is a bad strategy

YOU CAN'T PLAY 20 QUESTIONS WITH NATURE
AND WIN:
PROJECTIVE COMMENTS ON THE PAPERS OF THIS
SYMPOSIUM

Allen Newell
May, 1973

I am distressed. I can illustrate it by the way I was going to start my comments, though I could not in fact bring myself to do so. I was going to draw a line on the blackboard and, picking one of the speakers of the day at random, note on the line the time at which he got his PhD and the current time (in mid-career). Then, taking his total production of papers like those in the present symposium, I was going to compute a rate of productivity of such excellent work.. Moving, finally, to the date of my chosen target's retirement, I was going to compute the total future addition of such papers to the (putative) end of this man's scientific career. Then I was going to pose, in my role as discussant, a question: Suppose you had all those additional papers, just like those of today (except being on new aspects of the problem), where will psychology then be? Will we have achieved a science of man adequate in power and commensurate with his complexity? And if so, how will this have happened via these papers that I have just granted you?

Establishing selective inference

Manipulate a wide range of mental processes

working memory maintenance
pain
phonology
effort
visual selective attention
fear

Observe associated brain activation

Identify which processes can be decoded from brain activity

working memory maintenance
($p > 0.98$)

Establishes a selective association between mental states/processes and brain activity

Poldrack & Yarkoni, 2016, *Annual Review in Psychology*

Decoding tasks from fMRI

ABOUT

BLOG

Welcome to Cognitive Atlas

The Cognitive Atlas is a collaborative knowledge building project that aims to develop a knowledge base (or ontology) that characterizes the state of current thought in cognitive science. The project is led by Russell Poldrack, Professor of Psychology at Stanford University. Development of the project was supported by grant RO1MH082795 from the National Institute of Mental Health.

Mental Concepts

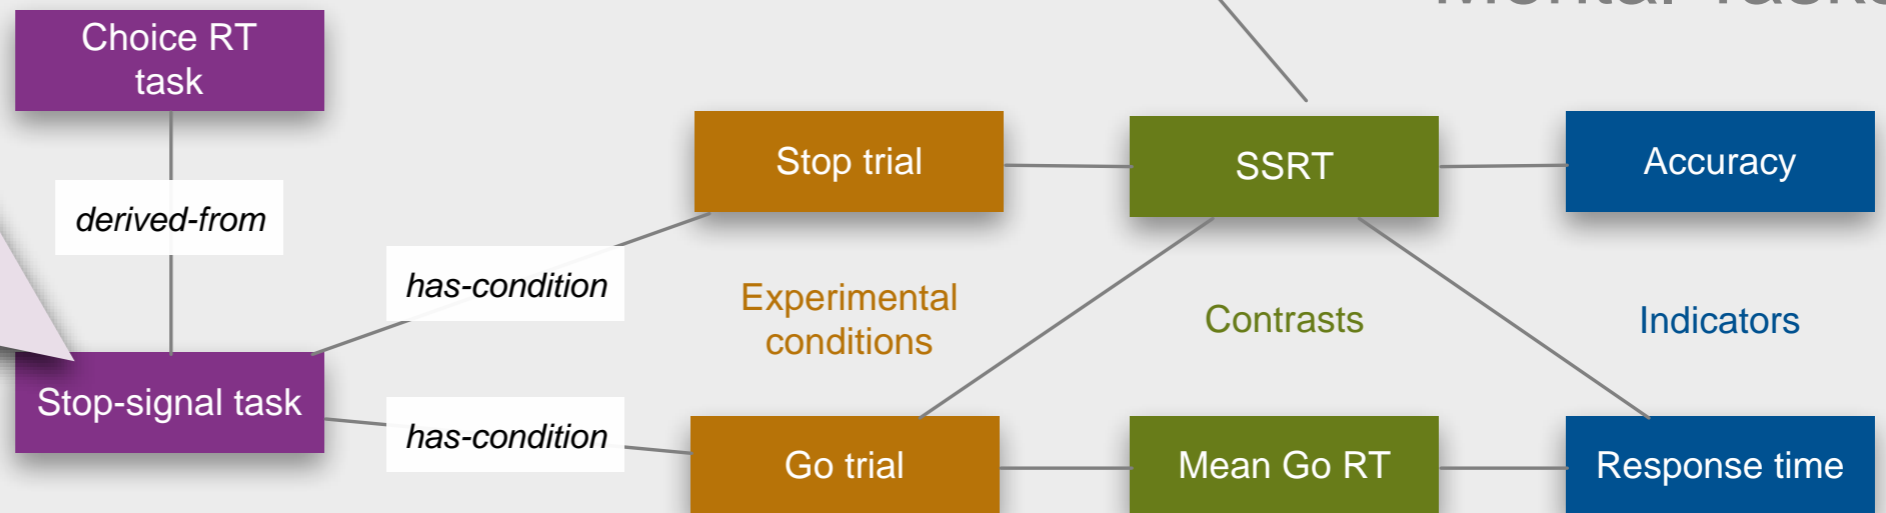

Response inhibition

Suppression of actions that are inappropriate in a given context and that interfere with goal-driven behavior.

Bibliography

Logan, G. D. & Cowan, W. B. (1984). On the ability to inhibit thought and action: A theory of an act of control. *Psychological Review*, 91, 295-327.

Mental Tasks

Stop-signal task

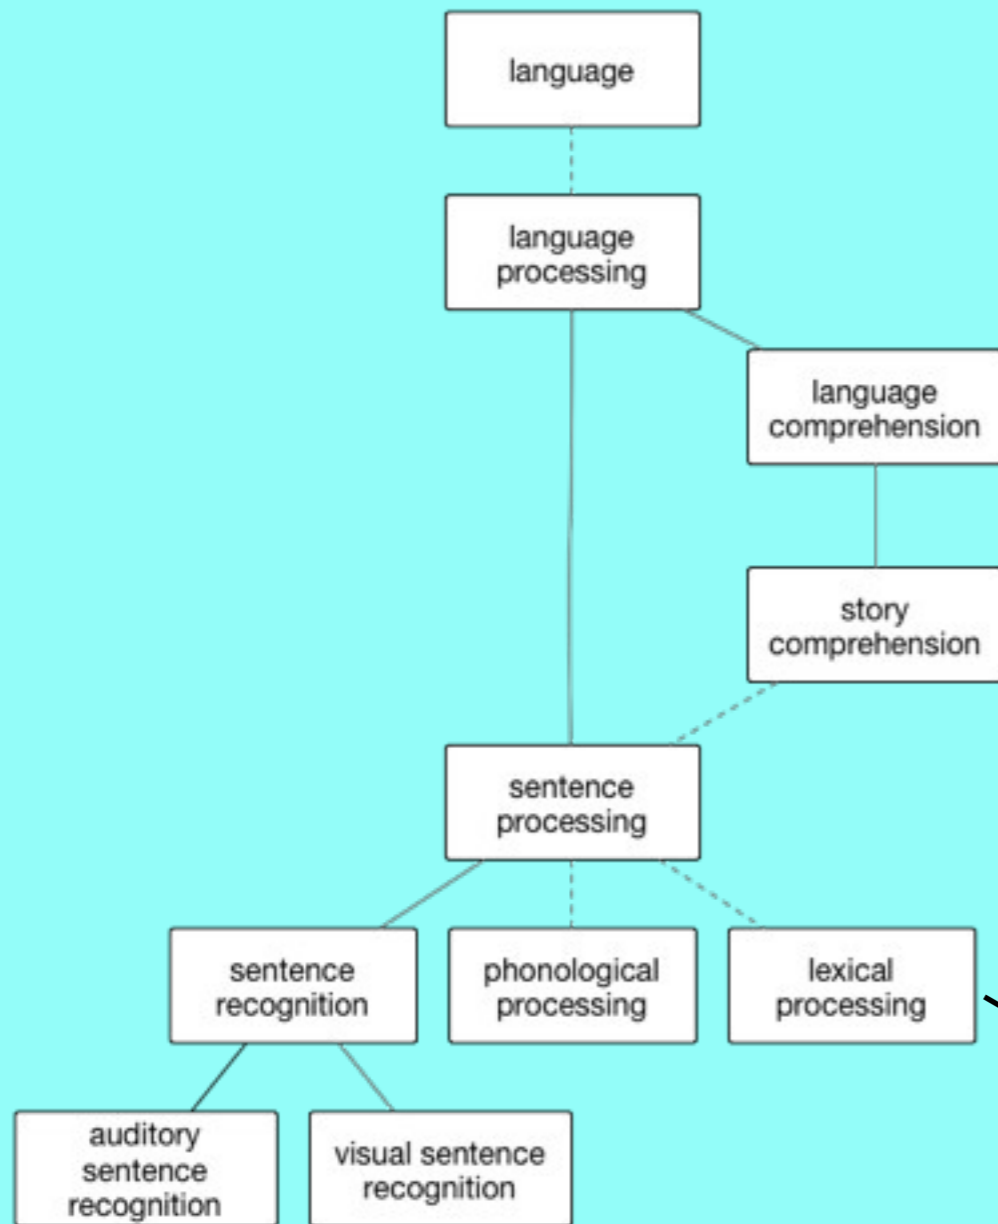

A task in which an external stimulus signals the participant to interrupt an already-initiated motor response.

Bibliography

Verbruggen, F., & Logan, G. D. (2008). Response inhibition in the stop-signal paradigm. *Trends in Cognitive Sciences*, 12, 418-424.

Selective inference: Summary

- Ontology-based meta-analysis provides basis for prediction of maps based on cognitive processes
- To advance we need:
 - More data
 - Better annotated data
 - A better ontology?
 - How would we know if ours is wrong?

What if the phrenologists had fMRI?

What if the phrenologists had fMRI?

What if the phrenologists had fMRI?

What if the phrenologists had fMRI?

Franz Yarkoni

phrenosynth.org

Phrenosynth is a platform for large-scale, automated synthesis of functional magnetic resonance imaging (fMRI) data.

It takes thousands of published articles reporting the results of fMRI studies, chews on them for a bit, and then spits out images like this:

An automated meta-analysis of 885 studies of suavity

“Multiple demand” areas: Phrenosynth

1890's biology textbooks

512 pages

408 pages

Linguistic evidence for conceptual revolution

- What proportion of Gene Ontology terms are mentioned in these books?

	Huxley	Parker	Overlap
biological process (28,566)	0.09% (26)	0.1% (32)	20
molecular function (10,057)	0 (0)	0 (0)	—
cellular component (3,903)	1.05% (41)	1.01% (40)	25

How much conceptual progress has psychology made?

- 22.9% of all Cognitive Atlas mental concepts are used at least once in James' Principles of Psychology
- Examples:
 - goal, deductive reasoning, effort, false memory, object perception, visual attention, task set, anxiety, mental imagery, unconscious perception, internal speech, primary memory, theory of mind, judgment

A broader view: Folk usage of ontology terms

- Analyzed Google N-Gram corpus (3.38 million books) for term mentions from 1800-2000
- Separated by phrase length
- Random sample from GO terms

Many psychological concepts are linguistically ancient

Cognitive Atlas concepts

Many psychological concepts are linguistically ancient

Neuroimaging: a perfect storm for irreproducibility

Making neuroscience
open and reproducible

WHO WE ARE

Reproducibility matters

Neuroscience research is the basis for critical decisions about health and society. Our first goal as researchers is to ensure that the results of our research will stand the test of time.

Enabling better research

We are expanding the OpenfMRI project into a free and open platform that will enable the analysis and sharing of neuroimaging data, harnessing the power of high-performance computing to improve the quality of research.

From data to discovery

Our platform will provide neuroimaging researchers with leading-edge tools to analyze and share large datasets, with a focus on quantifying the reproducibility of the results.

<http://reproducibility.stanford.edu>

Designing a more reproducible scientific enterprise

Designing a more reproducible scientific enterprise

Improving the choice architecture of science

- Choice architecture
 - particular set of features that drive people toward or away from particular choices
- Nudges
 - Improving incentives
 - Using the power of defaults
 - Providing feedback
 - Expecting and prevent errors

Threats to reproducibility: Low power

Power failure: why small sample size undermines the reliability of neuroscience

Katherine S. Button^{1,2}, John P. A. Ioannidis³, Claire Mokrysz¹, Brian A. Nosek⁴, Jonathan Flint⁵, Emma S. J. Robinson⁶ and Marcus R. Munafò¹

NATURE REVIEWS | **NEUROSCIENCE**

VOLUME 14 | MAY 2013 | 365

Sample size and power in fMRI studies

Median estimated sample size in 2015 = 43

Median effect size with 80% power = 0.61

Thanks to Sean David and Tal Yarkoni
for sample size data

Poldrack et al, submitted

What are realistic effect sizes for fMRI?

Estimated from HCP task data
using combined anatomical + neurosynth ROIs

Poldrack et al, submitted

Low power -> unreliable science

Positive Predictive Value (PPV): The probability that a positive result is true

Winner's Curse: overestimation of effect sizes for significant results

$$PPV = ([1 - \beta] \times R) / ([1 - \beta] \times R + \alpha)$$

Button et al., 2013

- “My result isn’t significant, so I need to add more subjects...”

Sample size flexibility

Fig. 1. Likelihood of obtaining a false-positive result when data collection ends upon obtaining significance ($p \leq .05$, highlighted by the dotted line). The figure depicts likelihoods for two minimum sample sizes, as a function of the frequency with which significance tests are performed.

-Simmons et al., 2011, Psychological Science

Improvement: always predetermine sample size

neuropowertools.org

NeuroPower

1. Load data 2. Estimate model 3. Power

Select your statistical parametric map for a certain contrast (T or Z) in nifti format (.nii, NOT .nii.gz).

Bladeren... spmT_0001.nii
Upload complete

Are the values Z- or T-values?
T

What is your peakforming threshold?
units = p-value
0.01

How many subjects?
18

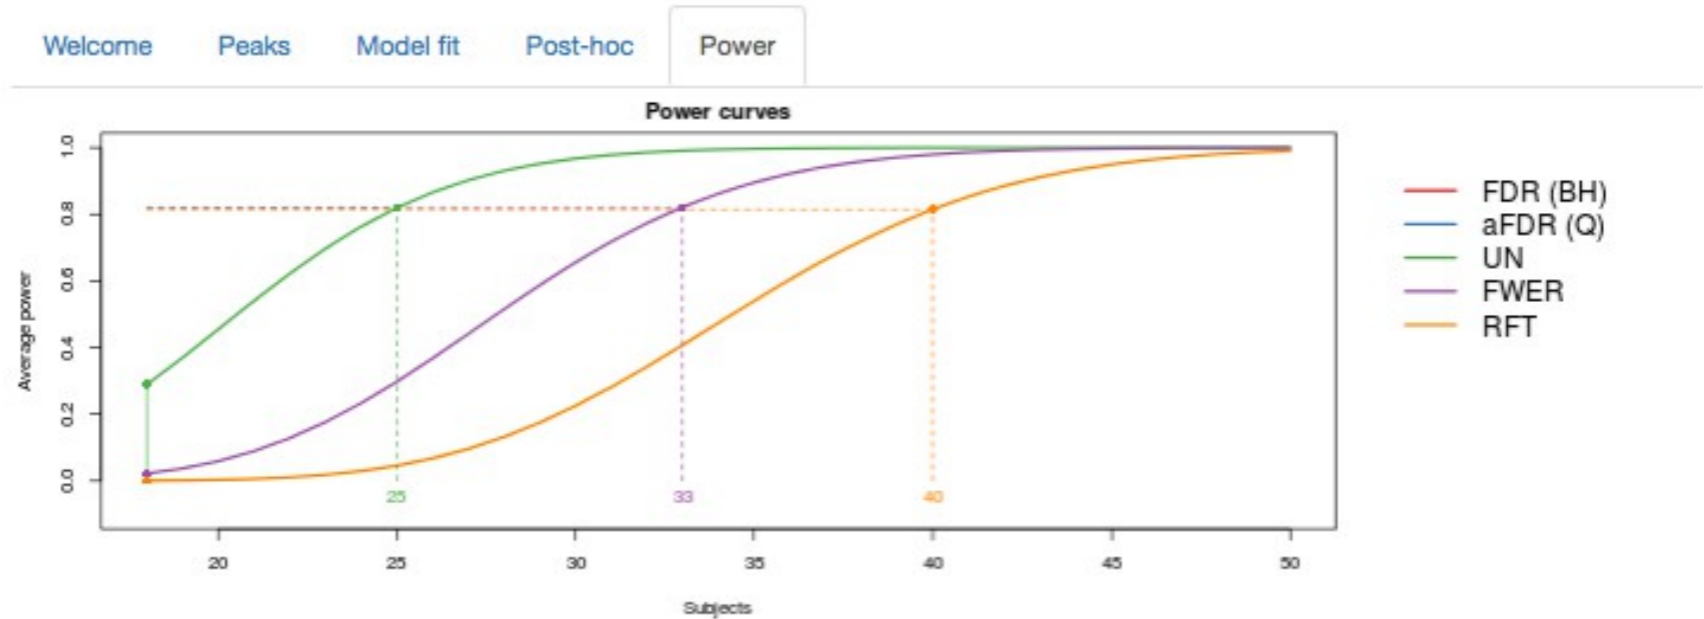

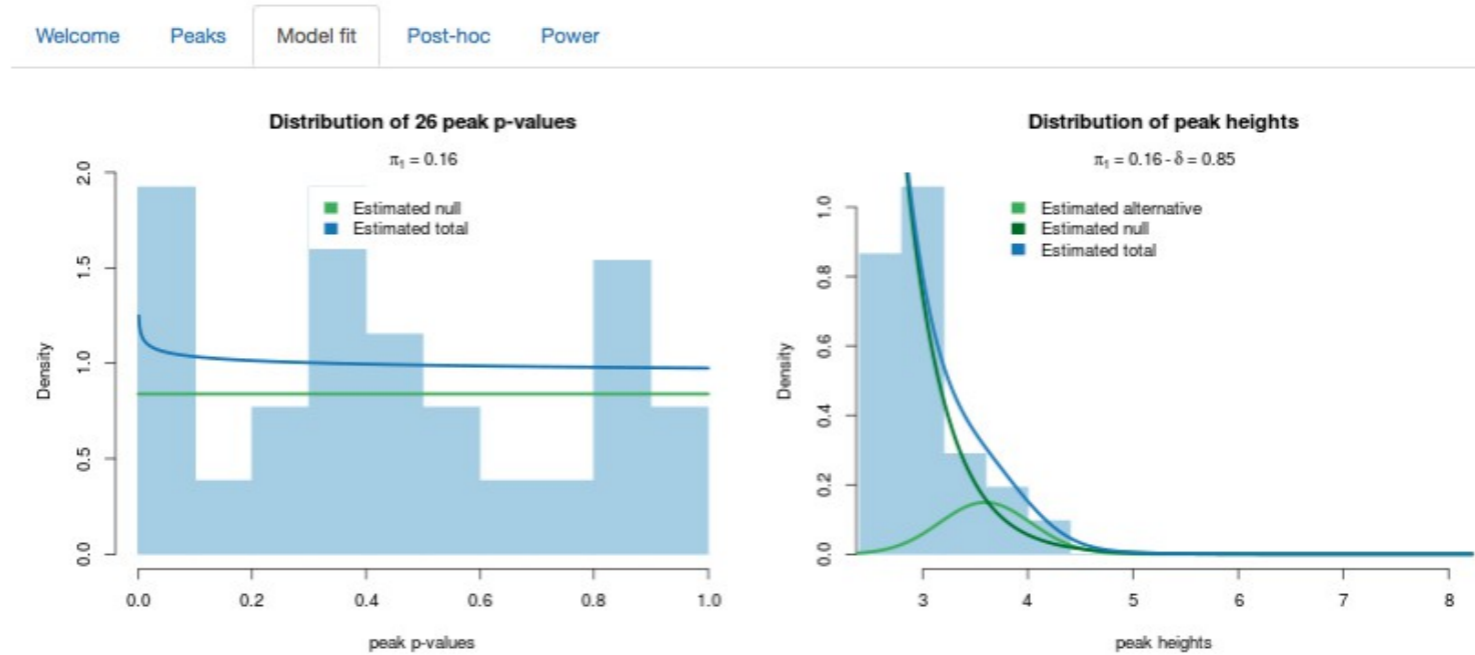

Is the study a one- or two-sample test?
One-sample

How do you want the smoothness to be defined?
 Estimate from the data
 Manual input

If manually: what is the FWHM in mm? (eg. '[8,8,8]')
[8,8,8]

If manually: What is the voxelsize? (eg. '[2,2,2.3]')
[3.9,3.9,4]

Extract peaks

To obtain a power level of 0.8 with RFT control at level 0.05, the minimal sample size is 40.

Joke Durnez

Threats to reproducibility: Methodological flexibility

- Using standard FSL analysis options
- 69,120 possible analysis workflows

Processing step	Reason	Options	Number of plausible options
Motion correction	Correct for head motion during scanning	Interpolation [linear vs. sinc] Reference volume [single vs. mean]	4
Slice timing correction	Correct for differences in acquisition timing of different slices	No/before motion correction/after motion correction	3
Field map correction	Correct for distortion due to magnetic susceptibility	Yes/No	2
Spatial smoothing	Increase SNR for larger activations and ensure assumptions of Gaussian random field theory	FWHM [4/6/8 mm]	3
Spatial normalization	Warp individual brain to match a group template	Method [linear/nonlinear]	2
High pass filter	Remove low-frequency nuisance signals from data	Frequency cutoff [100, 120]	2
Head motion regressors	Remove remaining signals due to head motion via statistical model	Yes/No If Yes: 6/12/24 parameters or single timepoint "scrubbing" regressors	5
Hemodynamic response	Account for delayed nature of hemodynamic response to neuronal activity	Basis function [single-gamma, double-gamma] Derivatives [none/shift/dispersion]	6
Temporal autocorrelation model	Model for the temporal autocorrelation inherent in fMRI signals.	Yes/no	2
Multiple comparison correction	Correct for large number of comparisons across the brain	Voxel-based GRF, Cluster-based GRF, FDR, nonparametric	4
Total possible workflows			69,120

Poldrack et al., submitted

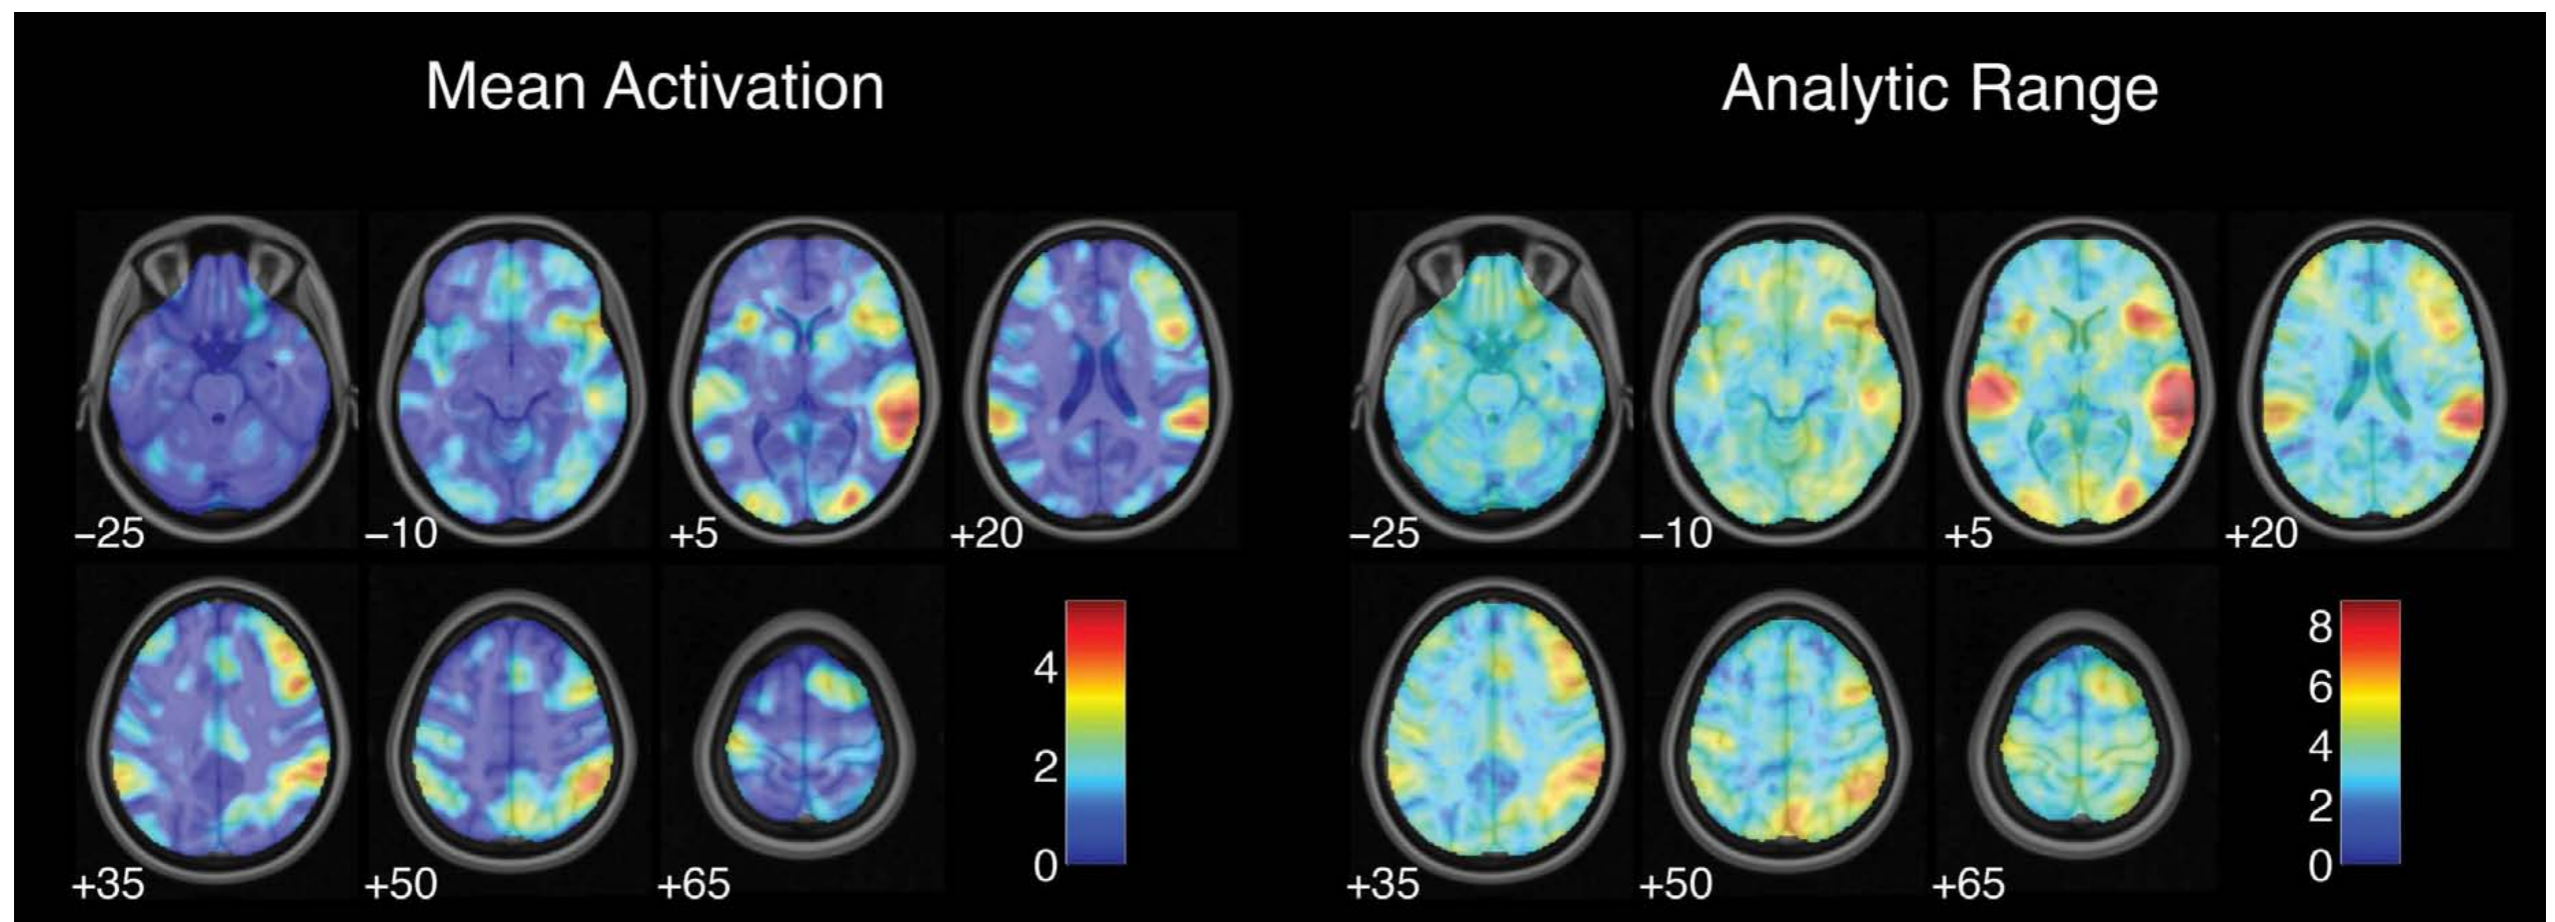

Threats to reproducibility: Methodological flexibility

On the plurality of (methodological) worlds: estimating the analytic flexibility of fMRI experiments

*Joshua Carp**

6,912 pipelines

Multiple comparison correction

- Assessed latest 100 papers matching query for fMRI activation studies
 - 65 reported whole-brain activation data
 - Good news
 - only 3 papers reported uncorrected results
 - Bad news
 - 11% of papers analyzed data using SPM/FSL but then corrected for multiple comparisons using AFNI's `alphasim/3dclustsim`
 - Why is this a problem?

Communal p-hacking?

- Eklund et al. (2016, PNAS)
 - “a 15 year old bug was found in 3dClustSim while testing the three software packages (the bug was fixed by the AFNI group as of May 2015, during preparation of this manuscript). The effect of the bug was an underestimation of how likely it is to find a cluster of a certain size (in other words, the p-values reported by 3dClustSim were too low).”
 - AFNI also underestimated smoothness

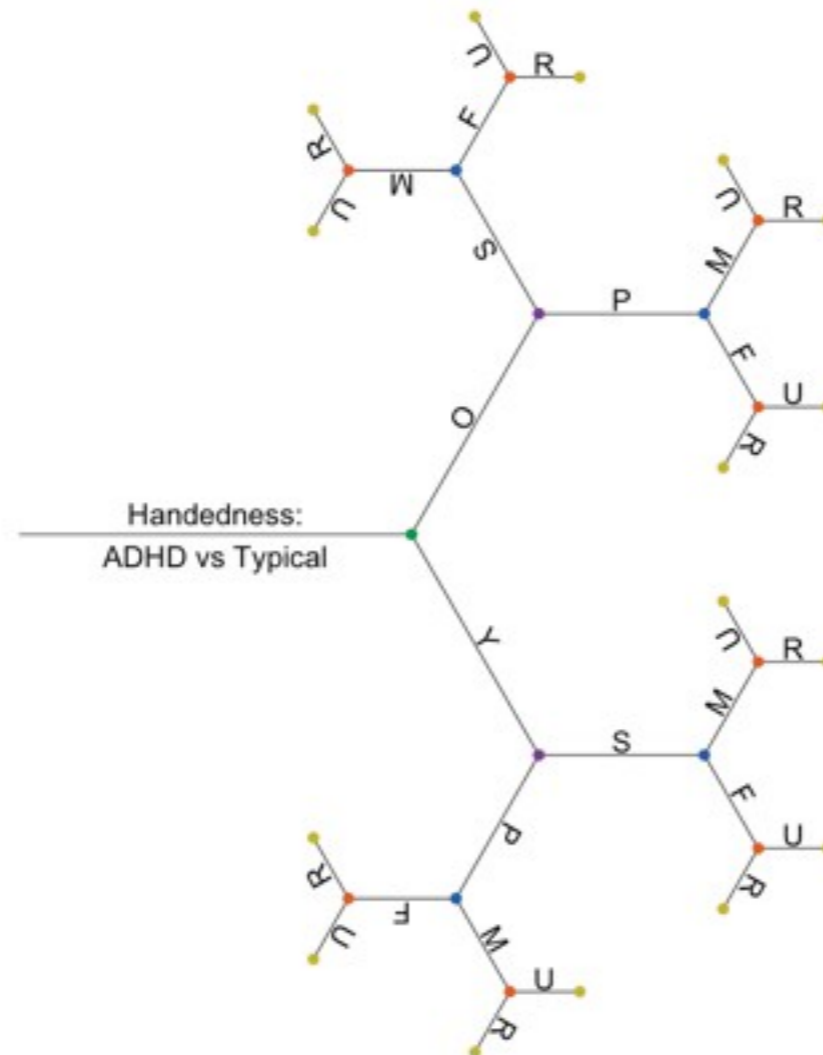

The garden of forking paths

The garden of forking paths: Why multiple comparisons can be a problem, even when there is no “fishing expedition” or “p-hacking” and the research hypothesis was posited ahead of time*

Andrew Gelman[†] and Eric Loken[‡]

14 Nov 2013

Bishop, 2016

The garden of forking paths

The garden of forking paths: Why multiple comparisons can be a problem, even when there is no “fishing expedition” or “p-hacking” and the research hypothesis was posited ahead of time*

Andrew Gelman[†] and Eric Loken[‡]

14 Nov 2013

Bishop, 2016

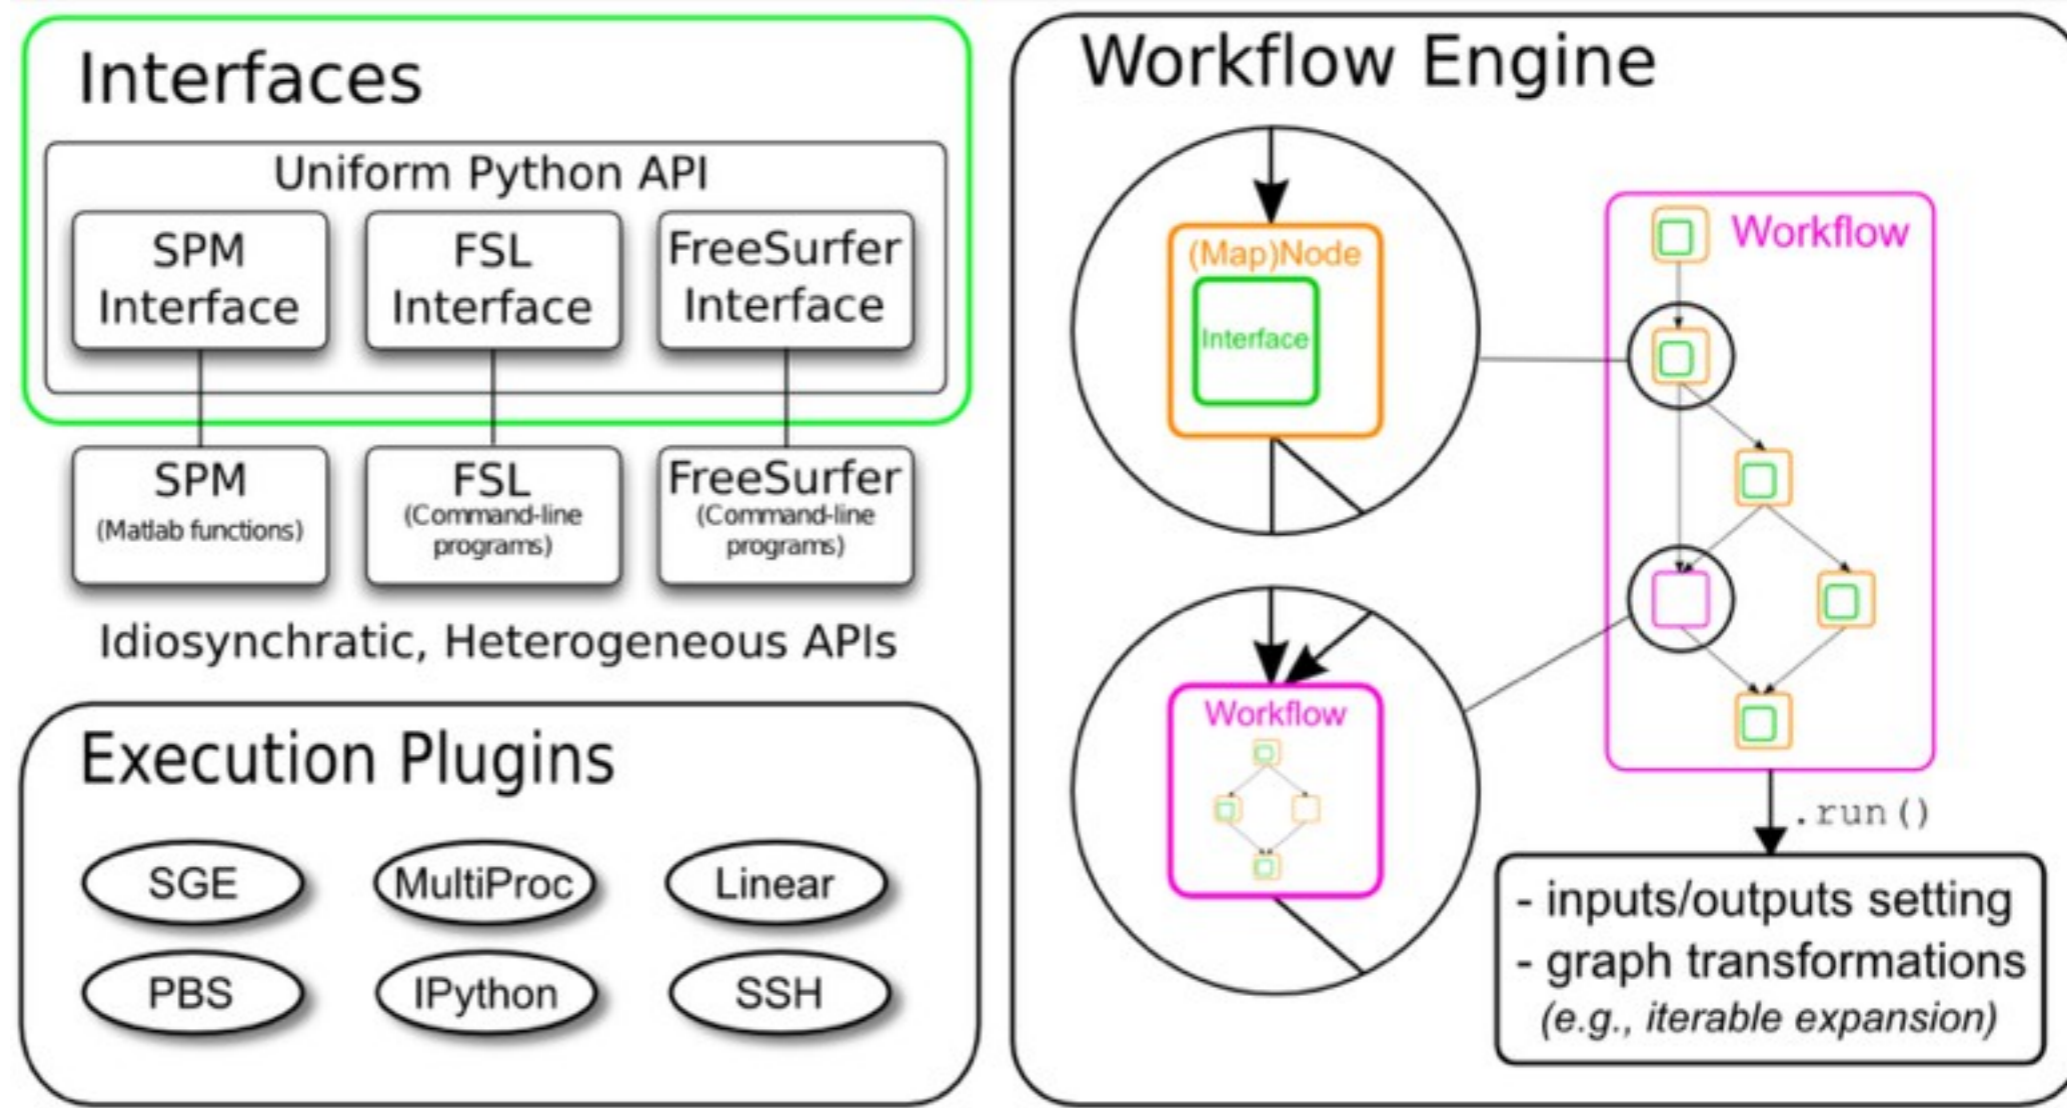

Improvement: Study pre-registration

- Register sample size and analysis plan up front
- This does not prevent exploratory analysis
 - But planned and exploratory analyses must be clearly delineated in the paper

Improvement: Mapping the garden

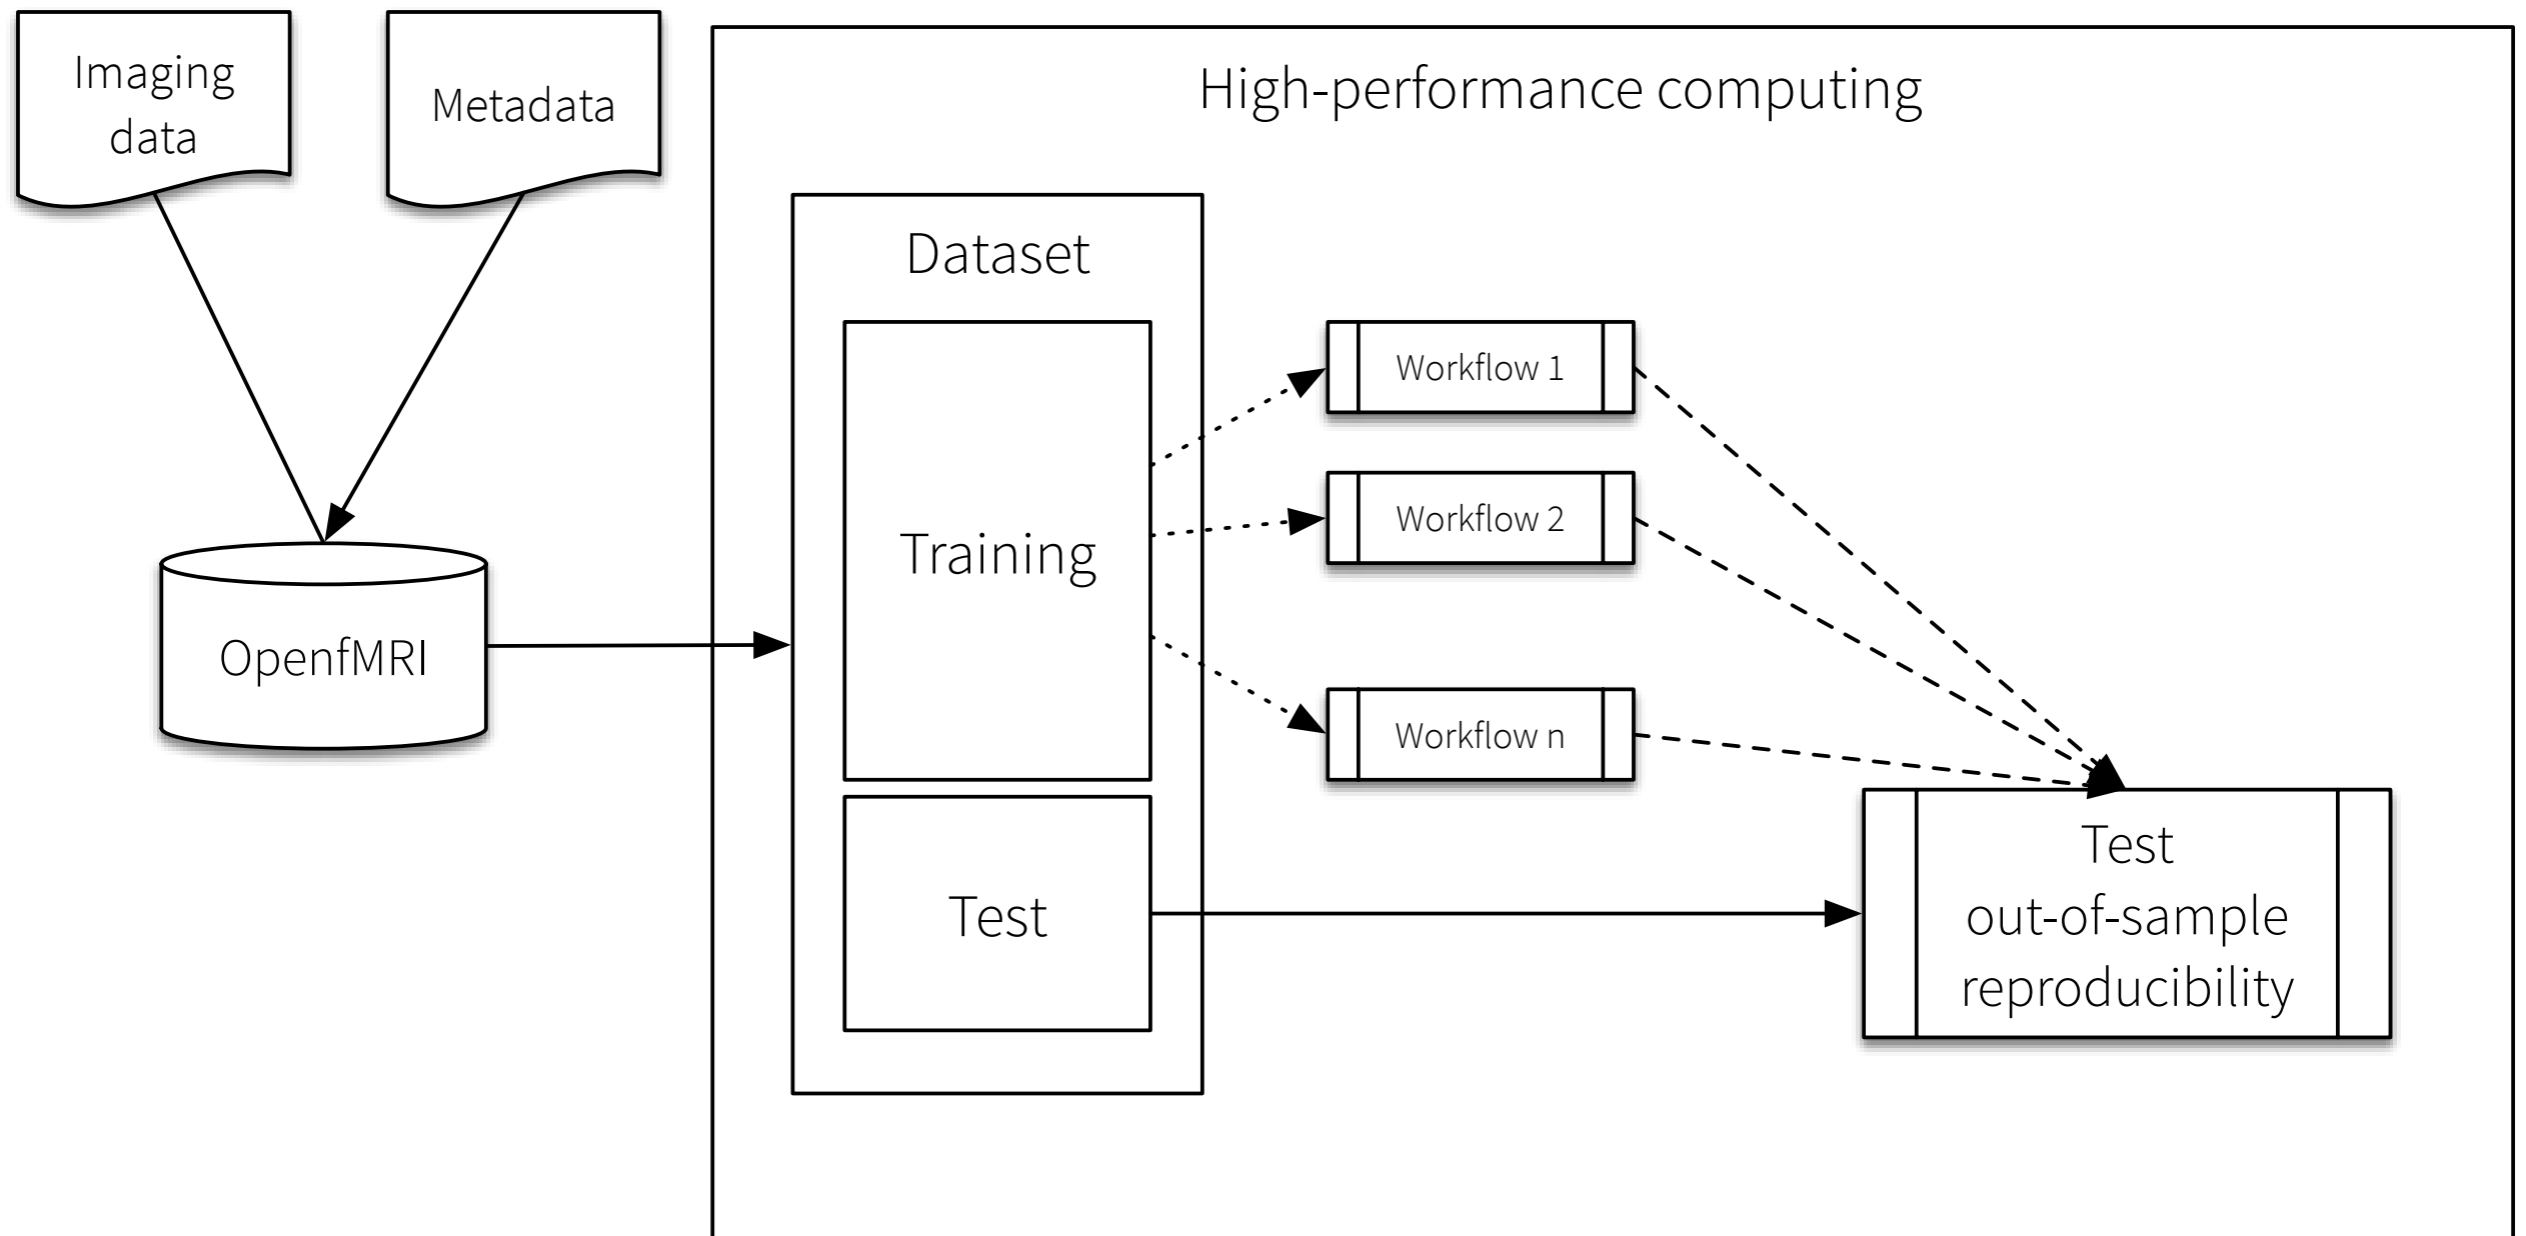

nipy.org

Tracking every analysis
allows a full characterization of exploration

Improvement: Quantifying “vibration of effects”

Focusing on finding generalizable results,
rather than hitting the $p < 0.05$ jackpot

Study reporting and transparency

- In 22 of the 65 papers we analyzed for multiple comparison procedures, it was impossible to identify precisely which correction technique was used
- beyond generic terms such as “cluster based correction”

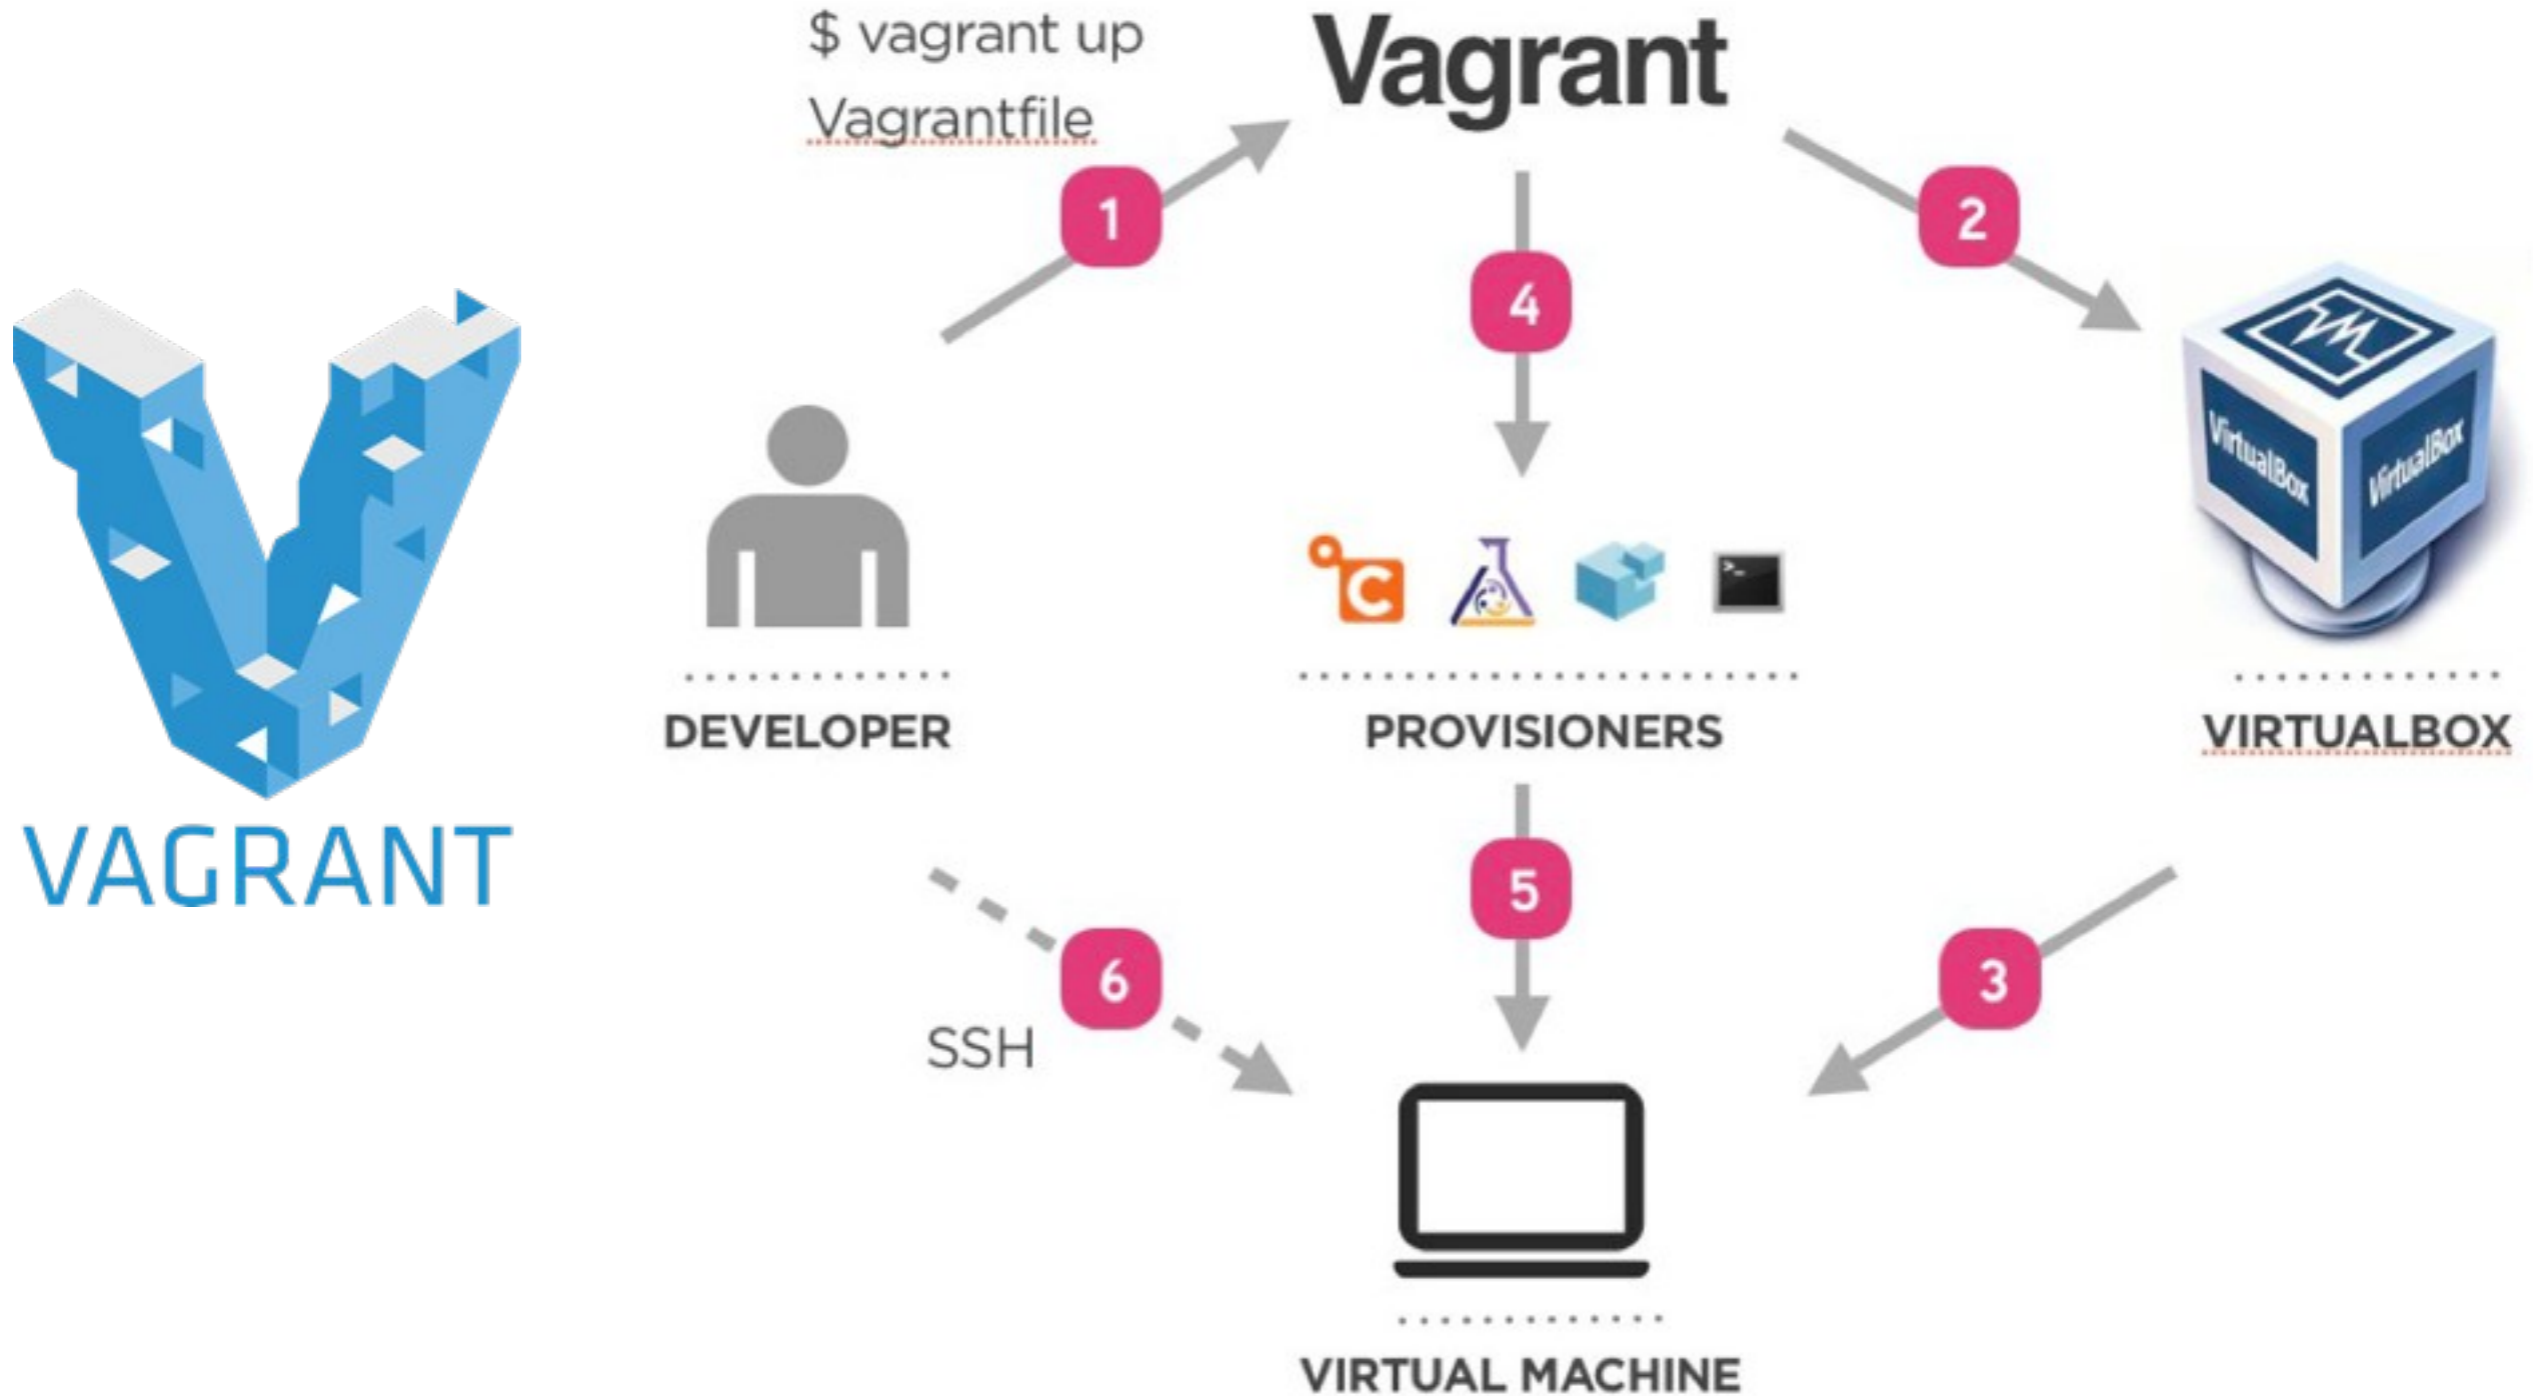

Improvement: Better study description

- OHBM Committee on Best Practices in Data Analysis and Sharing (COBIDAS) report
- www.humanbrainmapping.org/cobidas/
- In the future, tools may be able to automatically generate standards-compliant methods text from a nipype workflow

Improvement: Sharing of analysis platforms

- “an article about a computational result is advertising, not scholarship. The actual scholarship is the full software environment, code and data, that produced the result.” - Buckheit & Donoho, 1995
- The tale of myconnectome

MyConnectome-VM: A virtual machine to implement MyConnectome analyses.

The [MyConnectome project](#) is a project meant to investigate the relations between mind, brain, and body across an extended period of time in a single individual. One of the major goals of the project is to serve as a testbed for reproducible analysis practices. For this reason, we have released the data and as much code as possible for the processing and analyses.

Conclusions

- fMRI has come a long way in 20 years, but we have a long way to go
- We need to move towards approaches that will give us greater insight into selective mind-brain mappings
- “The first principle is that you must not fool yourself and you are the easiest person to fool”
- R. Feynman
- We need to redesign the choice architecture of fMRI methods so that it prevents rather than affords fooling ourselves
